

Projection Enabled Flight Experience

Dandelion™ creates immersive cabin design

DIEHL
Aerosystems

Characteristics

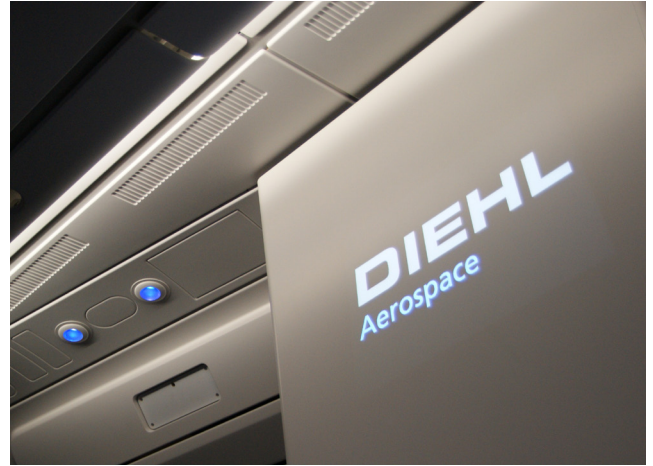

Dandelion™ has a broad range of design possibilities. The cabin ambience is enriched by the use of pictures and moving images. In combination, the harmonization of cabin illumination and cabin projection creates an outstanding passenger experience.

Creating images or cabin services and information is scaled to customer wishes starting with one projector and illumination on one panel or area up to composing images with several projectors over a wide area.

The Dandelion™ Projection Enabled Flight Experience System can be a stand-alone feature or integrated in the cabin management system of the aircraft. Illumination and projection are harmonized in order to create a synchronized ambience in the cabin with smooth transitions and scenarios. The user-friendly control panel allows the crew to easily and quickly access the projection and lighting scenarios.

Projection Enabled Flight Experience

Dandelion™ creates immersive cabin design

Benefits

Airline/Crew

The projection system offers the flexibility to change the cabin appearance not only during a single flight. Imagine the possibilities for code-sharing or charter flights by creating a different cabin appearance through software. This means no weight, no time, no cost. The integration of corporate identity colors is easily done. In addition, the placement of advertisement opens new revenue streams. Passenger guidance is convenient for the traveller, but it also supports the crew: boarding can be faster, more relaxed and more efficient.

Passenger

The projection system Dandelion™ can show the seat row. Baggage space within the stowage bins can also be displayed. Furthermore, the projection system creates a pleasant in-flight atmosphere. Shortly before landing the system provides information such as connecting flights or baggage claim locations.
